

Amendments to the Abstract:

Please amend the abstract to read as follows.

An object of the present invention is to provide an image forming apparatus having a developing device changing rotary with a small number of components, and for this purpose, the image forming apparatus according to the present invention is constructed to include the following construction: An image forming apparatus for forming an image on a recording material includes an image bearing member, first member. First and second developing means for devices developing a latent image formed on the image bearing member, second developing means for developing a latent image formed on the image bearing member, a member. A rotary member for holding holds the first and second developing means with a first device. First and second drive receiving part being parts are provided at [[a]] first and second side plate plates at [[one]] opposite end portion portions in a longitudinal direction of the rotary member, and a second drive receiving part being provided at a second side plate at the other end portion, a member. A rotary shaft having a includes first and second drive transmitting part parts engaged with the first and second drive receiving parts. part and a second drive transmitting part engaged with the second drive receiving part, and a driving source for driving drives the rotary shaft, which wherein when the rotary shaft is rotated by power of the driving power source, the power is transmitted to the first and second drive receiving parts and the rotary member is rotated. The rotary member includes a connecting member which has a “ \cap ” shaped section for connecting a center of the first side plate and a center of the second side plate.
